

Agency Blog SaaS — Demo

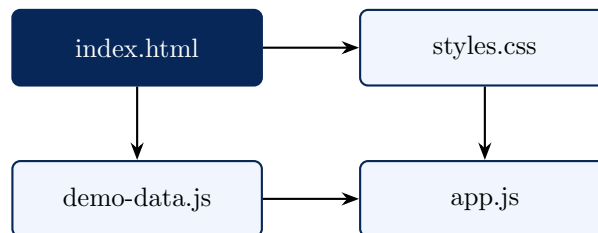

Brief

This documents the *demo* at `agency-blog-saas-demo/` — a fabricated, scripted product tour — not the real, private `agency-blog-saas` Django SaaS it visually mimics.

1 What it is

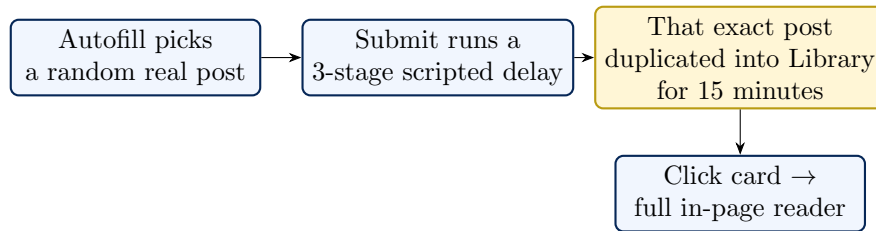

A single static HTML/CSS/JavaScript page, no server and no build step, reproducing the four core screens of a real, private production SaaS: an AI Blog Generator, a Blog Library, Subscription Packages, and Client Updates, plus an in-page article reader. No network request ever leaves the browser. The real system is a Django SaaS behind `digitalise.agency` doing genuine AI blog generation, credits, subscriptions, and per-client roles for real clients; its source stays private because it *is* the live commercial product. This demo lets a hiring panel click through the real feature set without exposing any of that.

2 Architecture

`demo-data.js` holds all content: `REAL_DAVONEX_POSTS` (15 real, already-public posts from a real client’s blog, fetched once and frozen — full text, images, references, all local), `GENERATOR_PRESETS` (derived one-per-post so the generator’s outcome is deterministic, not freshly invented per click), and `DEMO` (fabricated credit balance, real subscription tier prices, one invented illustrative client). `app.js` does all tab switching, the scripted generator sequence, the article reader, and the library’s countdown logic. `styles.css` copies `davonex.com`’s real public design tokens (colors, radii, shadows, component patterns) 1:1, per explicit owner direction, since that is the real, live client site this pipeline actually publishes to.

3 Key flow: generate then read

Every article, real or the fabricated duplicate, opens to the same reader component and always shows a provenance link back to the real `davonex.com/blog/{slug}/` URL.

4 The honesty pattern

Two rules run through the whole repository: nothing fabricated is ever shown without a visible label (a banner, a “Demo” ribbon, a countdown), and nothing real ever requires a live network call — real content is fetched once ahead of time and frozen into the repo. Real subscription prices and the real published test/coverage figures are shown verbatim because they were already public; anything client-specific beyond the one already-public content library is excluded.

5 Setup and license

No setup: open `index.html` or serve the folder statically. `netlify.toml` publishes the repo root with no build command. Licensed under PolyForm Strict License 1.0.0 (view/noncommercial use, no redistribution).

6 Glossary

Static page

Fixed HTML/CSS/JS files served as-is, no server-generated content per request.

DOM

The browser’s live model of the page’s HTML that JavaScript reads and rewrites while the page is open.

SaaS

Hosted software sold as a recurring subscription rather than installed software.

AEO / SEO

Structuring content so AI answer engines (AEO) or classic search engines (SEO) recommend or rank it.

Design tokens

Named CSS variables (e.g. `--blue`) standing in for raw values, making a whole visual system traceable to one source.
